### **Use Stimulate When Temperatures Exceed 90°F**

Whenever temperatures exceed 90°F, the plants lack sufficient IAA for cell division. It is during this period when cell division is limited that many of your bacterial diseases and some fungus diseases develop.

In order to protect the plants cell division and disease resistance, consider using 3-4 oz. per acre of Stimulate in any of the insecticide, fungicide, or foliar fertilizer sprays. This should be done on, approximately, 10 day intervals.

I hope this information is of value.
